

README (CC Import Tool)

Release Notes

Version 1.0.5

- Added the ability to (optionally) configure a class responsible for modifying applications after they are sync'd.

Version 1.0.4.1

- Smart validate now works for either some or all projects

Version 1.0.4

- Added "sync report" mode, which compared Protex projects and Code Center applications, and reports on any differences it finds.
- Ignore existing association mode added
- Fix for required cc.protex.name in multi-server mode

Version 1.0.2

- Option to delete Code Center requests
- Summary report at the end of each run that includes:
 - Total metrics for validations, imports
 - Total number of requests/added deleted
 - Total number of failed imports and validations with names.

Version 1.0.1

- SolEng Common Framework now drives configuration
- Multi-Protex support added
- Simplified usage
- Minor bug fixes
- Please see new usage for details
- Option to turn off and on the validation process.

Summary

Provides the ability to import all or a specific list of projects from Protex to Code Center.

USAGE for version 1.X.X and above:

1. Unpack zip and execute the batch or shell script inside the /bin/ directory
2. Provide full path of configuration files or use command line arguments (see below for valid arguments)
3. For multi-protex support, your configuration file must contain the following property:
 - a. server.list.location - This is the name of the server XML file relative to the configuration file.
 - b. server XML file - This is the file that defines your servers, the format of which is defined below.
 - c. Command line driven option does not offer multi-protex support.
4. An example configuration file can be found within the /properties/ directory

Configuration Options / Command Line

Note: Command line format: argument <space> value

Property Name	Command Line Argument	Description	Required	Default
protex.server.name	--p-server	URL of your Protex server	Yes, for single server mode	N/A
protex.user.name	--p-username	Protex login name	Yes, for single server mode	N/A
protex.password	--p-password	Password for that account	Yes, for single server mode	N/A

cc.server.name	--cc-server	URL of your Code Center server	Yes, for single server mode	N/A
cc.user.name	--cc-username	Code Center login name	Yes, for single server mode	N/A
cc.password	--cc-password	Password for that account	Yes, for single server mode	N/A
cc.protex.name	--protex-name	Name of the Protex configuration inside Code Center	Yes, for single server mode	N/A
cc.default.app.version	--default-app-version	The version that will be used for newly created application	Yes	N/A
cc.workflow	--workflow	Name of the Code Center workflow that will belong to the application	Yes	N/A
cc.owner	--owner	The Code Center account that will be assigned to this application	Yes	N/A
cc.submit.request	--submit	True/False as to whether the components for your application should be submitted	No	false
validate.application	--validate	Whether to proceed with validation of newly created application	Yes	false
validate.application.smart	N/A	True/False. If true, activates a date checking algorithm that performs a validation only if the Protex Refresh date is newer than the last validation date. This can significantly increase performance as this only performs costly validations against those applications which really need it.	No	false
protex.project.list	--project	Custom list of projects. Optional version can be added to list: Comma separated pair of name and version. Format <projectName>;<version>,<projectName2>;<version2>,etc	Leave blank for ALL projects	blank
validate.requests.add	N/A	As part of the validation process, enable true if you want components found only in Protex to be added	No	true
validate.requests.delete	N/A	As part of the validation process, enable true if you want requests found only in Code Center to be deleted	No	false
server.list.location	N/A	Location of server.xml file	Yes, for multi server mode	blank

generate.report	N/A	If set to true, instead of synchronizing Protex and Code Center, the utility generates a report that shows any application/project differences between Code Center and Protex. The report is written to sync_report.xlsx in the working directory from which the utility was run.	No	false
cc.ignore.associations*	N/A	<p>If true: the CCImporter will ignore associations by application name, and do a direct lookup in the database to get the internal association id. This setting should be true if there are previously imported applications in Code Center that have been renamed or modified.</p> <p>If false: the CCImporter will attempt to make the association through the SDK which matches by project/application name. This will fail when Code Center applications aren't named the same as Protex projects and already have an existing association.</p>	No	false
app.adjuster.classname	N/A	If set, this property specifies a class (that implements the AppAdjuster interface) that will be invoked on each application after it is sync'd, giving that code an opportunity to modify the application. This feature is probably of limited use unless/until more AppAdjuster classes are developed.	No	N/A

**DB access must be granted to the Code Center Server*

Server List XML Configuration

The XML file should follow the following format

Sample Server Configuration

```
<servers>
  <server>
    <alias>Protex7Test</alias>
    <server.name>http://myProtexServer</server.name>
    <user.name>user@blackducksoftware.com</user.name>
    <password>blackduck</password>
    <application>PROTEX</application>
  </server>
  <server>
    <alias>Seneca7</alias>
    <server.name>http://some.other.server/</server.name>
    <user.name>user@blackducksoftware.com</user.name>
    <password>blackduck</password>
    <application>PROTEX</application>
  </server>
  <server>
    <server.name>http://myCodeCenterserver/</server.name>
    <user.name>ccUser</user.name>
    <password>blackduck</password>
    <application>CODECENTER</application>
  </server>
</servers>
```

USAGE for version .7 and below:

```
java -jar cclmporter.jar [-getProjectList | -importProjectList | -importAllProjects]
```

-getProjectList : Displays a list of projects in Protex assigned to the user
-importProjectList : Imports the projects specified in the context.xml file into Code Center.
-importAllProjects : Imports all user assigned Protex projects into Code Center.

PRE-REQUISITES:

A. Both Protex SDK and Code Center SDK need to be enabled.

B. Protex server needs to be configured in Code Center.

C. Update context.xml file:

1. Update protexSDKClient bean with Protex server URL, username, and password
2. Update codecenterSDK620Client with Code Center URL, username, and password
3. Update importerInputs:

- protexServerName: Name of Protex server association shown in Code Center > Administration > Settings > Protex
- defaultVersion: Version to use if version is not specified in project list
- workflowName: Name of workflow to associate with project
- onwer: Username of Code Center application owner
- submitRequest: true/false if component requests should be submitted.

If there are custom required fields or steps in the request process, a true value will cause the import to error.

- protexProjectList: List of Protex projects names to import into Code Center.

The list needs to be delimited by carriage returns (newlines).

An optional version may be specified with each project after a comma (i.e. Project 1, v1.0)

If the version isn't specified, the default version will be used (specified above)

KNOWN ISSUES:

- If a Protex project's Bill of Materials contains a component that is a license, the import for that project will fail.
- If the request process in Code Center contains custom required fields, or if the approvers are set at request time, set the submitRequest to false.
- If your requested Protex project is already associated to a different Code Center application, the import will fail. **(Fixed as of 1.0.4)**
